      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              APPEARS TO REMAIN CELL ATTACHED UNLESS RELEASED BY HEPARIN.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; PLGF-1 AND PLGF-2 (SHOWN HERE);
ARE PRODUCED BY ALTERNATIVE SPLICING. PLGF-1 DIFFERS FROM PLGF-2
IN LACKING A 21 RESIDUES SEGMENT IN THE C-TERMINAL SECTION WHICH
ACTS AS A CELL RETENTION SIGNAL.
TISSUE SPECIFICITY: WHILE BOTH FORMS ARE PRESENT IN MOST PLACENTAL
TISSUES, THE LONGER FORM IS SPECIFIC TO EARLY (8 WEEK) PLACENTAL
AND ONLY THE SHORTER FORM IS FOUND IN THE COLON AND MAMMARY
CARCINOMAS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: N-GLYCOSYLATED. SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBCELLULAR LOCATION: BOTH FORMS ARE SECRETED BUT THE LONGER FORM

The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF

                                  Using plasmid pTB796, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB796 was obtained, which (IFO 14701, FRM BP-1 harbors the plasmid pTB796 was obtained, which (IFO 14701, FRM BP-1 harbors the plasmid pTB796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its anglogenic action for e.g. thrombosis or arteriosclerosis. It can all anglogenic action for e.g. thrombosis or arteriosclerosis. A mutein be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular briand linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human basic fibroblast growth factor; human bFGF mutein C86; growth promoting activity; growth stimulating activity; phage M13-PC86; capillary endothelial cells; angiogenic activity.

និនិនិនិនិនិន្និន្ន

residue sequence Pro-Asp-Gly-Arg which constitutes residues 36-35 basic FGF; it is also antagonistic to acidic FGF. The antagonist modulates growth of epithelial (and related) cells and can be use diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF

residues 36-39

                                       Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/p7B796 was obtained, which (IFO 14701, FRRM BP-1661) harbors the plasmid p7B796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. The mutein has high stability and is low in toxicity. The moutein has high stability and is low in toxicity. The moutein has high stability and is low in toxicity. The postoperative it issues or as a therapeutic drug based on its or postoperative it issues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human basic fibroblast growth factor; human bFGF mutein C86; growth promoting activity; growth stimulating activity; phage M13-PC86; capillary endothelial cells; angiogenic activity.

It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 may be replaced by Ser, ans Ile 138 is replaced by Ser.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rhbFGF mutein C137 (encoded by N90407) lacks 9 C-terminal amino acids of basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Muteins of basic fibroblast growth factor - lacking carboxy terminal amino acids, having growth promoting and angiogenic activities.

It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation: Cys 70, Cys 88 and Ile 138 have been replaced by Ser

                                                                                                                                                                                                                                     The invention relates to recombinant production of fusion proteins using CC fusion partners that lack leader sequences. The nucleic acids, vectors, cc host cells and methods disclosed may be used to recombinantly produce CC large quantities of fusion proteins, in which the fusion partner lacks a CC leader sequence, via fermentation culture according to standard CC recombinant DNA methodologies. The pollypeptide of interest is cleaved CC wariety of polypeptides may be produced in this manner including enzymes, CC growth factors, single chain antibodies DNA -/RNA- binding proteins, CC growth factors, single chain antibodies DNA -/RNA- binding proteins, CC membrane receptors, mutant [GFBP-3s and fragments of them. Additionally, CC the invention may be used in the screening of libraries of random CC polypeptides by assays for their biological function. When fused to an CC Interleukin-1-like (IL-1-like) polypeptide, the random peptides or a ccumulate in a protected cellular compartment in a soluble active form. CC Leaderless fusion proteins may be produced in a wide variety of host CC cells (e.g. Escherichia coll), in a soluble, active and easily crecoverable form at temperature at or close to the physiological optima CC for host cell growth. A wide variety of polypeptides, including those CC that are otherwise unstable or insoluble may be expressed as fusions with the II-1-like polypeptides or other leader deleted translocating CC poptides. Sequences y17992-996 represent five members of the II-1-like CC protein family.

                                                                                                                                                                                                                                                               Using plasmid pTB795, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB795 was obtained, which (IFO 14700, FERM BP-1660) harbors the plasmid pTB795 expressing the mutein represented here. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its anglogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human basic fibroblast growth factor; human bFGF mutein N14; growth promoting activity; growth stimulating activity; phage M13-PN14; capillary endothelial cells; angiogenic activity.

It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                  26-JAN-1988;

20-SEP-1988;
rhbFGF mutein C129 (encoded by N90406) lacks 18 C-terminal amino acids of basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing cf, eg burns, wounds and postoperative tissues, as a drug for thrombosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 198
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mutein of basic fibroblast growth factor - having fibroblast growth promoting activity, growth stimulating activity of capillary endothelial cells and angiogenic activity

                           rhbFGF mutein C$23C129 (encoded by N90408) lacks 18 C-terminal AAs of basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 have been replaced by Ser

It has high fibroblast growth promotin vasoendothelial cell growth promoting, and angiogenic activities, and high stability and low toxicity. It is used to accelerate healing of, burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

It has high fibroblast growth promoting vasoemoothelial cell growth promoting, and angiogenic activities, and lipid stability and low toxicity. It is used to accelerate healing of, burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                                                           New fibroblast growth factor peptide(s) - used to inhibit cell growth in culture or retinopathy, glomerulonephritis, melanoma

                                  Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/p7B796 was obtained, which (IFO 14701, FERM BP-1 harbors the plasmid p7B796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can all be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular briand linkages are reduced or eliminated.
                                                                                                                                                                                                                               Mutein of basic fibroblast growth factor having fibroblast growth promoting activ activity of capillary endothelial cells:
                                                                                                                                                                                                                                                                                                                                                                                                    20-FEB-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           residue sequence Pro-Asp-Gly-Arg which constitutes residues 36-39 of basic FGF; it is also antagonistic to acidic FGF. The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                                                  Sequence
                                                                                                                                                                The peptide bFGF(24-68)-NH2 (100mcg/ml) radioactive bFGF bound to the BHK cells affinity to bind heparin.
                                                                                                                                                                                                                                                                                                                      New fibroblast growth factor peptide(s) - used to inhibit cell growth in culture or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US5252718-A

                                                                                                                         Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/p7B796 was obtained, which (IFO 14701, FERM BP-1661 harbors the plasmid p7B796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridge and liberos are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human basic fibroblast growth factor; human bFGF mutein growth promoting activity; growth stimulating activity; capillary endothelial cells; angiogenic activity.
                                                                                                                                                                                                                                                                                                                              Mutein of basic fibroblast growth factor - having fibroblast growth promoting activity, growth stimulating activity of capillary endothelial cells and anglogenic activity
                                                                                                  and linkages are reduced or eliminated. See also N81971-97.
